

Day 8 Playbook

Day 8 — Deploy & Harden

Person E — Database, Automation & Coordinator

Prepared for Day 8 | Thursday, August 20, 2026

*Day 8 is the live verification of the complete production automation chain. Work the steps in order, check the tag on each one, and use the vibe-coding prompt(s) for the parts tagged **PROMPT** — then read what it gives you before you trust it, since the **MANUAL** steps around it are usually the ones that catch a mistake early.*

YOUR DAY 8 TASK (from the build plan)

“Verify the full n8n → backend → database chain using a real GitHub push.”

Depends on: Person C's Day 8 deployed production backend and Person E's Day 6 automation workflow.

Step-by-Step

[PROMPT] = the vibe-coding prompt below generates this for you · **[MANUAL]** = you do this yourself (setup, running it, testing, coordinating, judgment calls) — a prompt can't do these for you.

- 1 **[MANUAL]** Update the production n8n workflow environment variables to point at Person C's live deployed backend URL (<https://your-backend.onrender.com>).
- 2 **[MANUAL]** Configure a real GitHub repository with the production n8n webhook URL and shared secret.
- 3 **[MANUAL]** Execute an authentic end-to-end test: push a real code commit to the GitHub repository.
- 4 **[MANUAL]** Monitor the complete event cascade live: 1) GitHub Webhook Delivery: status 200 OK, 2) n8n Workflow Execution: runs and passes HMAC check, 3) Backend Processing: generates new resume version via Gemini + docx, 4) Database: new row inserted in resume_versions.
- 5 **[PROMPT]** Create an automated pipeline health monitor script (scripts/monitor_pipeline.py) that periodically checks webhook latency and database queue health. Use the vibe-coding prompt.
- 6 **[MANUAL]** Lead the midday standup: confirm the end-to-end production loop is verified with all 5 teammates.
- 7 **[MANUAL]** Commit production automation workflow configurations to the repository.

QUICK COMMANDS

```
python scripts/monitor_pipeline.py
git add workflows/ scripts/
git commit -m "Verify live production n8n -> backend -> DB pipeline with real GitHub push"
git push
```

Vibe-Coding Prompt(s)

VIBE-CODING PROMPT — Pipeline verification monitor script:

Write a Python monitoring script `scripts/monitor_pipeline.py` that: 1) Queries the production backend `/health` endpoint; 2) Checks PostgreSQL connection and queries the latest record timestamp in `resume_versions`; 3) Sends a lightweight ping to the n8n webhook test URL; 4) Prints a formatted status table with status badges (HEALTHY / DEGRADED / OFFLINE), latency in ms, and total processed resume versions count.

A prompt only covers the steps tagged PROMPT above — everything tagged MANUAL still needs you, even on a good day.

Definition of Done — Day 8

- [] Real GitHub push triggers full production n8n -> backend -> database pipeline.
- [] New resume version generated and stored in production database automatically.
- [] Webhook delivery, HMAC verification, and backend latency all verified under 10s.
- [] Pipeline health monitor script working cleanly.
- [] Workflow configurations and documentation pushed to repo.

For Tonight's End-of-Day Teach-Back

Perform a real commit and push to GitHub live on screen-share, switch over to the production database to show the new resume version appearing automatically, and celebrate the working end-to-end loop with the team.
